QUESTION	ANSWER
1. What is the purpose of the OSI model?	The OSI model is a conceptual framework used to describe how data is transmitted over a network. It consists of seven layers, each representing a different aspect of network communication.
2. What are the seven layers of the OSI model?	The seven layers of the OSI model are: Physical, Data Link, Network, Transport, Session, Presentation, and Application.
3. What is the difference between a hub and a switch?	A hub is a simple network device that connects multiple devices together. It broadcasts data to all devices connected to it. A switch is a more intelligent network device that can direct traffic to the specific device it is intended for.
4. What is the difference between a router and a switch?	A router is a network device that connects different networks together. It directs traffic between networks. A switch is a network device that connects multiple devices together within a single network.
5. What is the difference between a firewall and an intrusion detection system (IDS)?	A firewall is a network security device that monitors and controls incoming and outgoing network traffic. An IDS is a network security device that monitors network traffic for signs of a security breach.
6. What is the difference between a VPN and a proxy server?	A VPN is a secure connection between two devices over a public network. A proxy server is a server that acts as an intermediary between a client and a destination server.
7. What is the difference between a DNS server and a DHCP server?	A DNS server is a server that translates domain names into IP addresses. A DHCP server is a server that automatically assigns IP addresses to devices on a network.
8. What is the difference between a web browser and a web server?	A web browser is a software application that allows users to access and view web pages. A web server is a computer system that stores and serves web pages.
9. What is the difference between a client and a server?	A client is a device that requests services from a server. A server is a device that provides services to clients.
10. What is the difference between a network and the Internet?	A network is a group of devices connected together. The Internet is a global network of networks.
